

GRACE/GRACE FO for Monitoring Hydrological Extremes and Groundwater

Bailing Li

ESSIC University of Maryland/NASA GSFC

WWAO Connecting the Drops Webinar

July 24, 2025

Outline

- 1) Update on the hydrological extreme study using GRACE/FO
(Rodell & Li, 2023; Li & Rodell, 2023)
Total intensity indicates intensification of hydrological extremes
- 2) GRACE/FO data assimilation for global groundwater estimates (GLDAS2.2)
(Li et al., 2019)
Validation results; Tools for accessing data
- 3) Future gravity measuring missions

The Gravity Recovery and Climate Experiment (GRACE, 2002-2017) and GRACE-Follow-on (FO, 2018-present) missions

Image source: NASA

- The satellite systems measure gravity
- GRACE/FO TWS represents integrated observations: soil moisture, groundwater, snow and surface water
- Coarse spatial resolution: 150,000 km²
- Monthly mass changes

1. GRACE/FO for examining changes in hydrological extremes

Motivation

Erftstadt-Blessem, Germany, 2021

Sao Paulo, Brazil, 2015

Limitations of gauge data:

- Limited in number and spatial distribution (more in developed countries); various density across watersheds
- Inadequate to reflect depth and extent of severe extremes
- Difficult to draw global conclusions
 - IPCC AR5&AR6 :regional changes; low confidence on global scale changes

Benefits of GRACE/FO observations:

- Global coverage and nearly continuous record since 2002
- Reflect changes in all water compartments affected by hydrological extremes

Identifying extreme events

Define wet and dry anomalies at grid cells

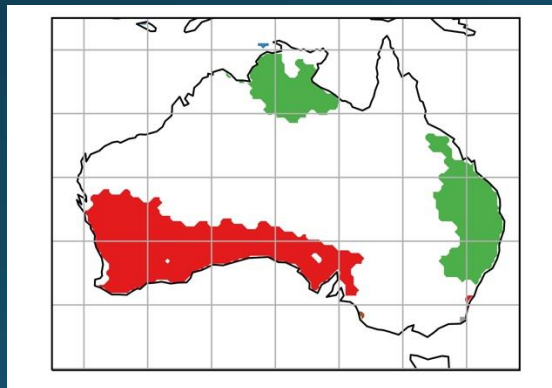

3-D dry or wet anomalies

ST-DBSCAN
Spatial and temporal clustering

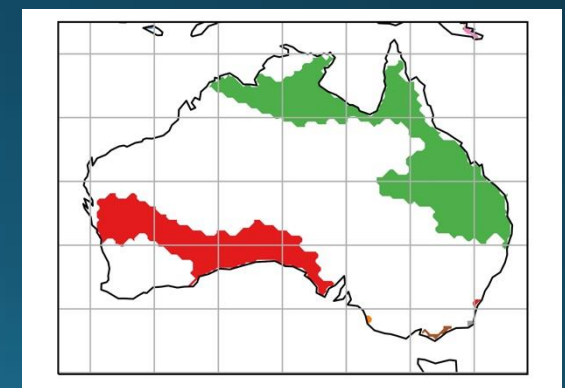

Month 1

Month 2

Month 3

Event 1

Event 2

Shaded areas represent TWS anomalies

Hydrological extremes derived from GRACE/FO data (2002-2024)

Spatial distribution of 1229 events

Image source: NASA Scientific Visualization Studio

Events occurred in each year

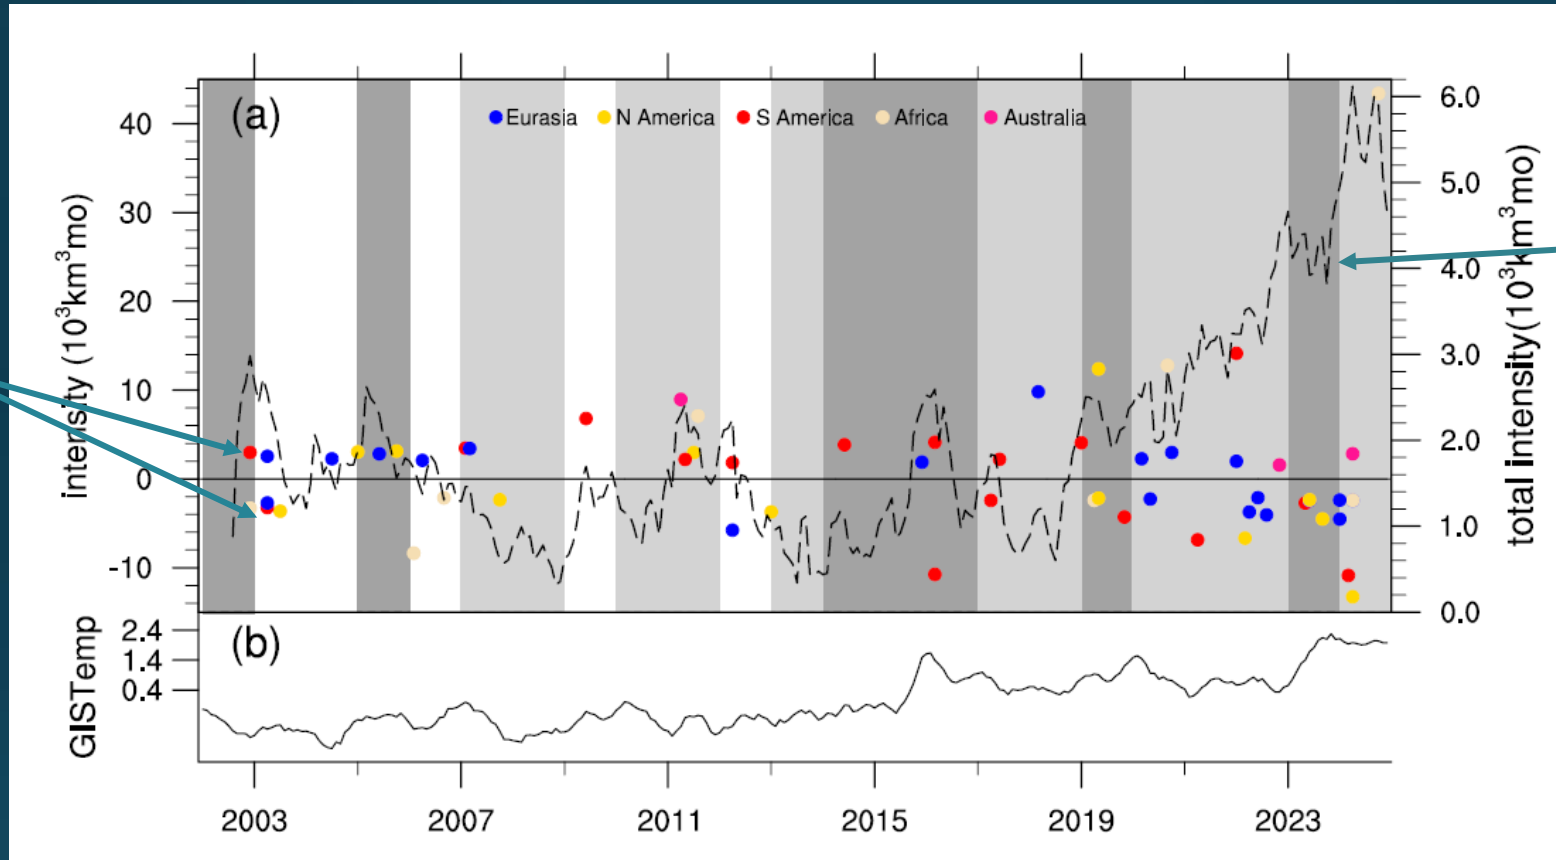

- The diameter of spheres is proportional to intensity, $\sum_S \sum_T TWS \text{ anomalies}$
- The color keys for the spheres are provided in the right figure.
- Watch animation of these events at: <https://svs.gsfc.nasa.gov/5565/>

Characteristics of extremes:
frequency of occurrence, extent,
duration, severity and intensity

Intensification of hydrological extremes

Colored dots represent top 30 wet and top 30 dry events

Total intensity: sum of monthly intensities of all wet and dry extremes

- Consistent with increases in extreme precipitation and prolonged dry spells
- reflect changes in all aspects of hydrological extremes (severity, frequency of occurrence, duration and extent)

2. Global GRACE/FO data assimilation for groundwater estimates

Purposes:

- Separate TWS into components
- Constrain model simulation
- Spatial and temporal downscaling

The Catchment land surface model (CLSM)

Image source: Zaitchik et al. 2008

Advantages:

- More realistic representation of near surface processes
- Global application
- Computational efficiency

Limitations:

- No surface water and groundwater withdrawals

$$\text{CLSM TWS} = \text{SMC} + \text{GWS} + \text{SWE}$$

The ensemble Kalman filter for assimilating GRACE/FO data

Ensemble update equation

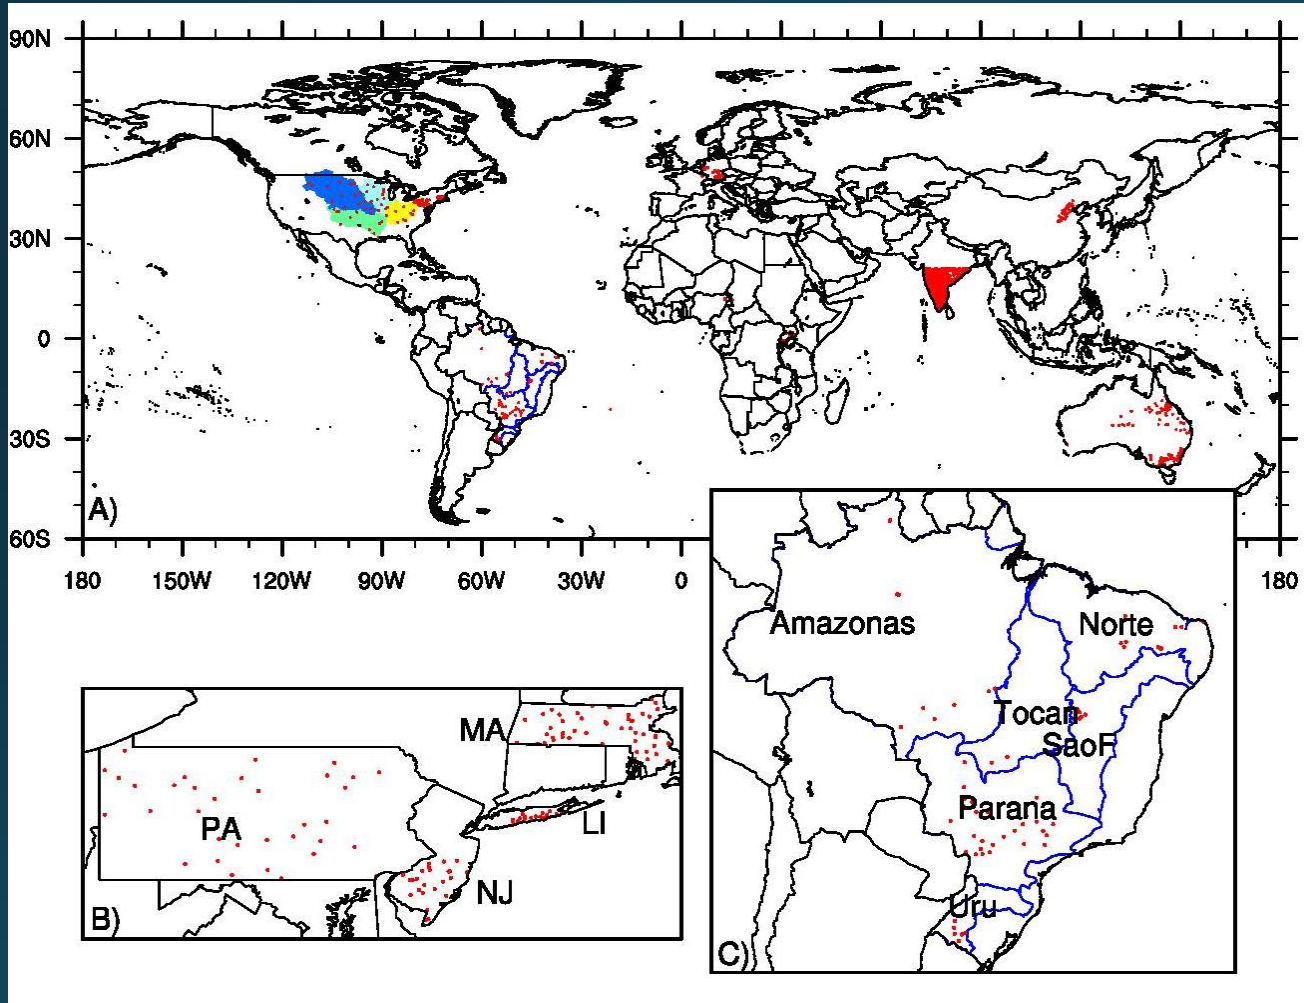

X: soil moisture,
groundwater, SWE
simulated by the model
at finer spatial and
temporal resolutions

$$X^a = X^f + K(Y - H(X))$$

The diagram shows the ensemble update equation $X^a = X^f + K(Y - H(X))$ enclosed in a yellow box. A red arrow points from the text 'X: soil moisture, groundwater, SWE simulated by the model at finer spatial and temporal resolutions' to the term X^f . Two blue arrows point down into the equation: one from 'GRACE obs' to the Y term, and another from 'Predicted obs' to the $H(X)$ term. A blue arrow points up into the equation from the text 'Kalman gain matrix' to the K term.

- Model mean TWS is added to GRACE TWS anomalies before assimilation
- The Kalman gain matrix depends on relative errors between the model and observations
- Model errors are represented by ensemble spreads

Global evaluation results using nearly 4,000 wells

Average statistics over 22 regions

	GRACE DA	OL	
RMSE(cm)	4.3	6.7	down 36%
correlation	0.65	0.56	up 16%

Well selection criteria:

- Unconfined aquifers
- Not impacted by pumping or injection
- >5 years of data

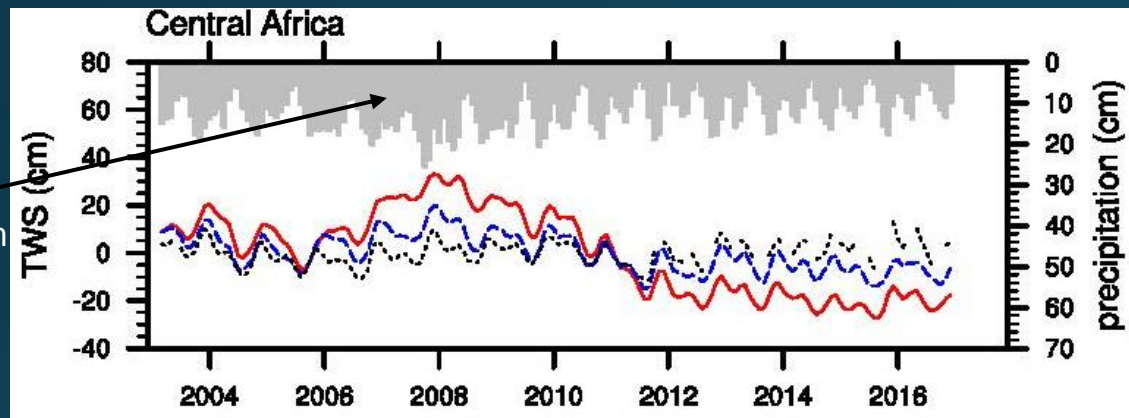

TWS and groundwater storage anomalies in central Africa

TWS for the blue rectangular region

11 wells

Groundwater storage

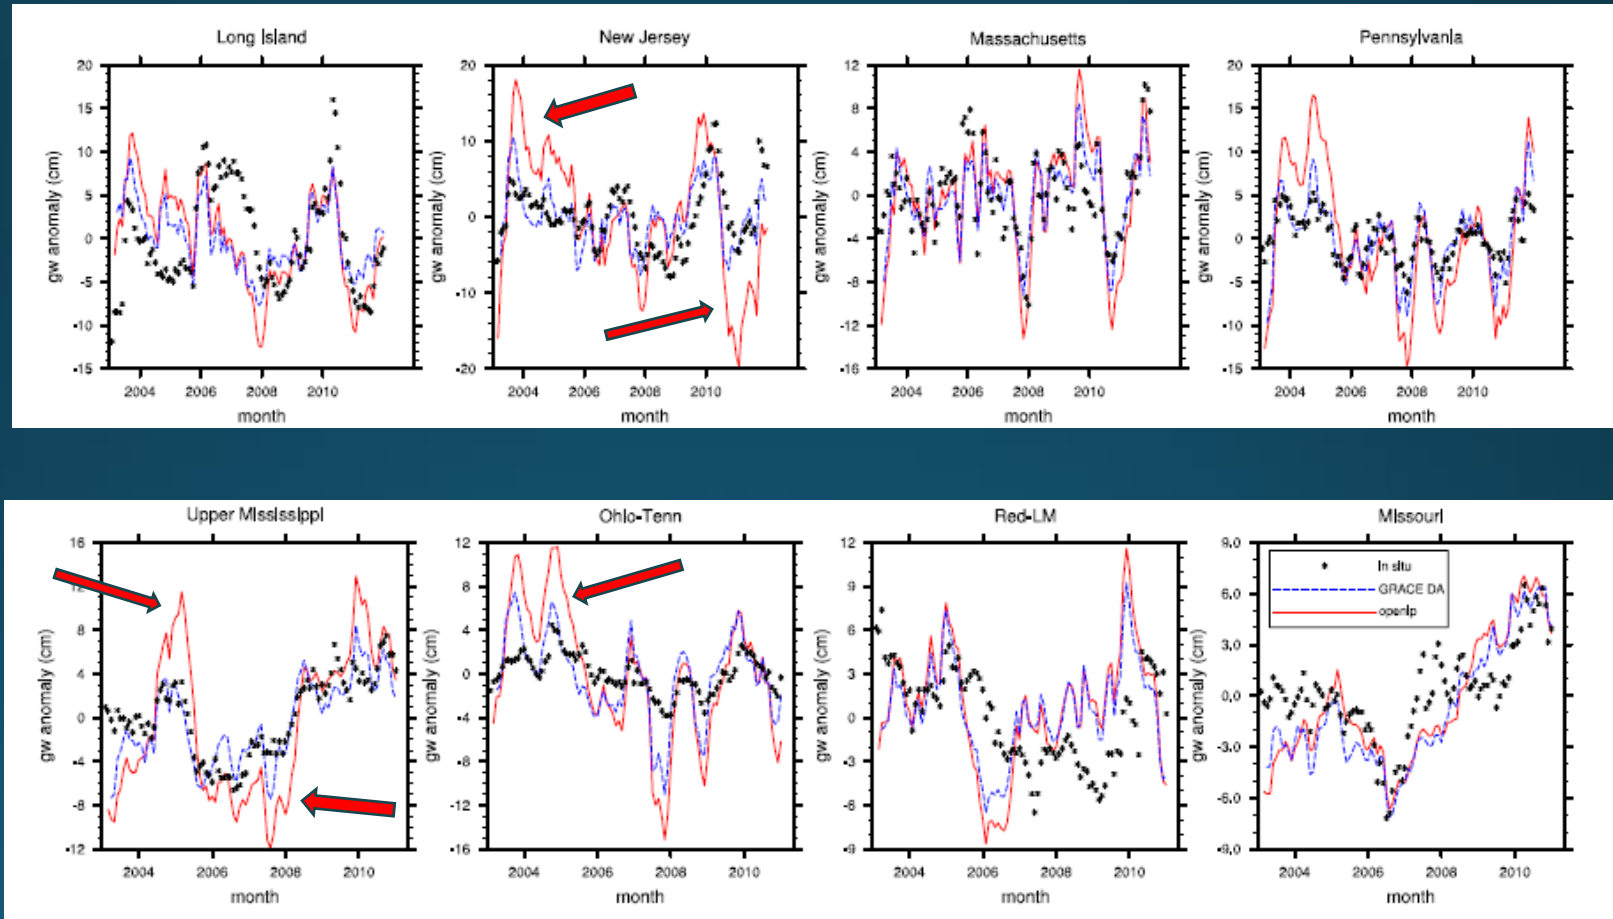

precipitation

	DA	OL
RMSE(cm)	5.34	17.2
correlation	0.56	-0.05

Evaluation results using USGS wells in the Northeast US and Mississippi basin

Well locations

TWS and groundwater storage anomalies in the North China Plain

50 wells in
North China
Plain

	DA	OL
RMSE (cm)	11.32	12.09
Correlation	0.83	0.61

GRACE DA GWS is unable to stimulate the large dynamics in well data because CLSM does not simulate groundwater withdrawals.

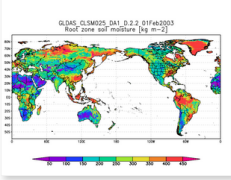

GLDAS2.2 at GES DISC

(https://disc.gsfc.nasa.gov/datasets/GLDAS_CLSM025_DA1_D_2.2/summary?keywords=GLDAS)

The screenshot shows the NASA EarthData GES DISC website. The header includes the NASA logo, 'EARTHDATA', and a search bar. The main title is 'GES DISC'. Below it, there's a navigation bar with 'Data Collections', 'GLDAS', and a search icon. The page content is titled 'Global Land Data Assimilation System' and 'GLDAS Catchment Land Surface Model L4 daily 0.25 x 0.25 degree GRACE-DA1 V2.2 (GLDAS_CLSM025_DA1_D)'. It features a world map showing the model output, a 'Cloud Enabled' badge, and a 'View Full-size Image' link. The main text describes the GLDAS-2.2 product and its components. On the right, there's a 'Data Access' section with buttons for 'Online Archive', 'Earthdata Search', 'Giovanni', 'Web Services', and 'Subset / Get Data'. At the bottom, there's a navigation bar with 'Product Summary', 'Variables', 'Data Citation', 'Documentation', and 'References'.

GLDAS Catchment Land Surface Model L4 daily 0.25 x 0.25 degree GRACE-DA1 V2.2 (GLDAS_CLSM025_DA1_D)

 **Cloud Enabled**
[View Full-size Image](#)

NASA Global Land Data Assimilation System Version 2 (GLDAS-2) has three components: GLDAS-2.0, GLDAS-2.1, and GLDAS-2.2. GLDAS-2.0 is forced entirely with the Princeton meteorological forcing input data and provides a temporally consistent series from 1948 through 2014. GLDAS-2.1 is forced with a combination of model and observation data from 2000 to present. GLDAS-2.2 product suites use data assimilation (DA), whereas the GLDAS-2.0 and GLDAS-2.1 products are "open-loop" (i.e., no data assimilation). The choice of forcing data, as well as DA observation source, variable, and scheme, vary for different GLDAS-2.2 products.

GLDAS-2.2 is new to the GES DISC archive and currently includes a main product from CLSM-F2.5 with Data Assimilation for the Gravity Recovery and Climate Experiment (GRACE-DA) from February 2003 to present. The GLDAS-2.2 data are available in two production streams: one with GRACE data assimilation outputs (the main production stream), and one without GRACE-DA (t ...[more](#))

3. Future gravity measuring missions

1. GRACE-C is in the administration's FY26 budget and will launch in 2028
 - Similar design as GRACE/FO
2. Next generation gravity missions: a second pair of satellites is actively under study and is planned for launch in 2032 to improve spatial and temporal resolutions of measurements. See additional info at:

https://www.esa.int/Applications/Observing_the_Earth/FutureEO/The_future_of_gravity_is_MAGIC

Conclusions

1. GRACE/FO data are valuable for studying and monitoring changes in hydrological extremes
 - groundwater losses & thawing of permafrost
2. GRACE/FO data assimilation is an effective tool for constraining large-scale groundwater simulation
 - There are limitations with the model and the ensemble Kalman filter
 - Evaluation is key to gain better understanding
 - Convert water levels to groundwater storage using the specific yield
